GAMMA-400

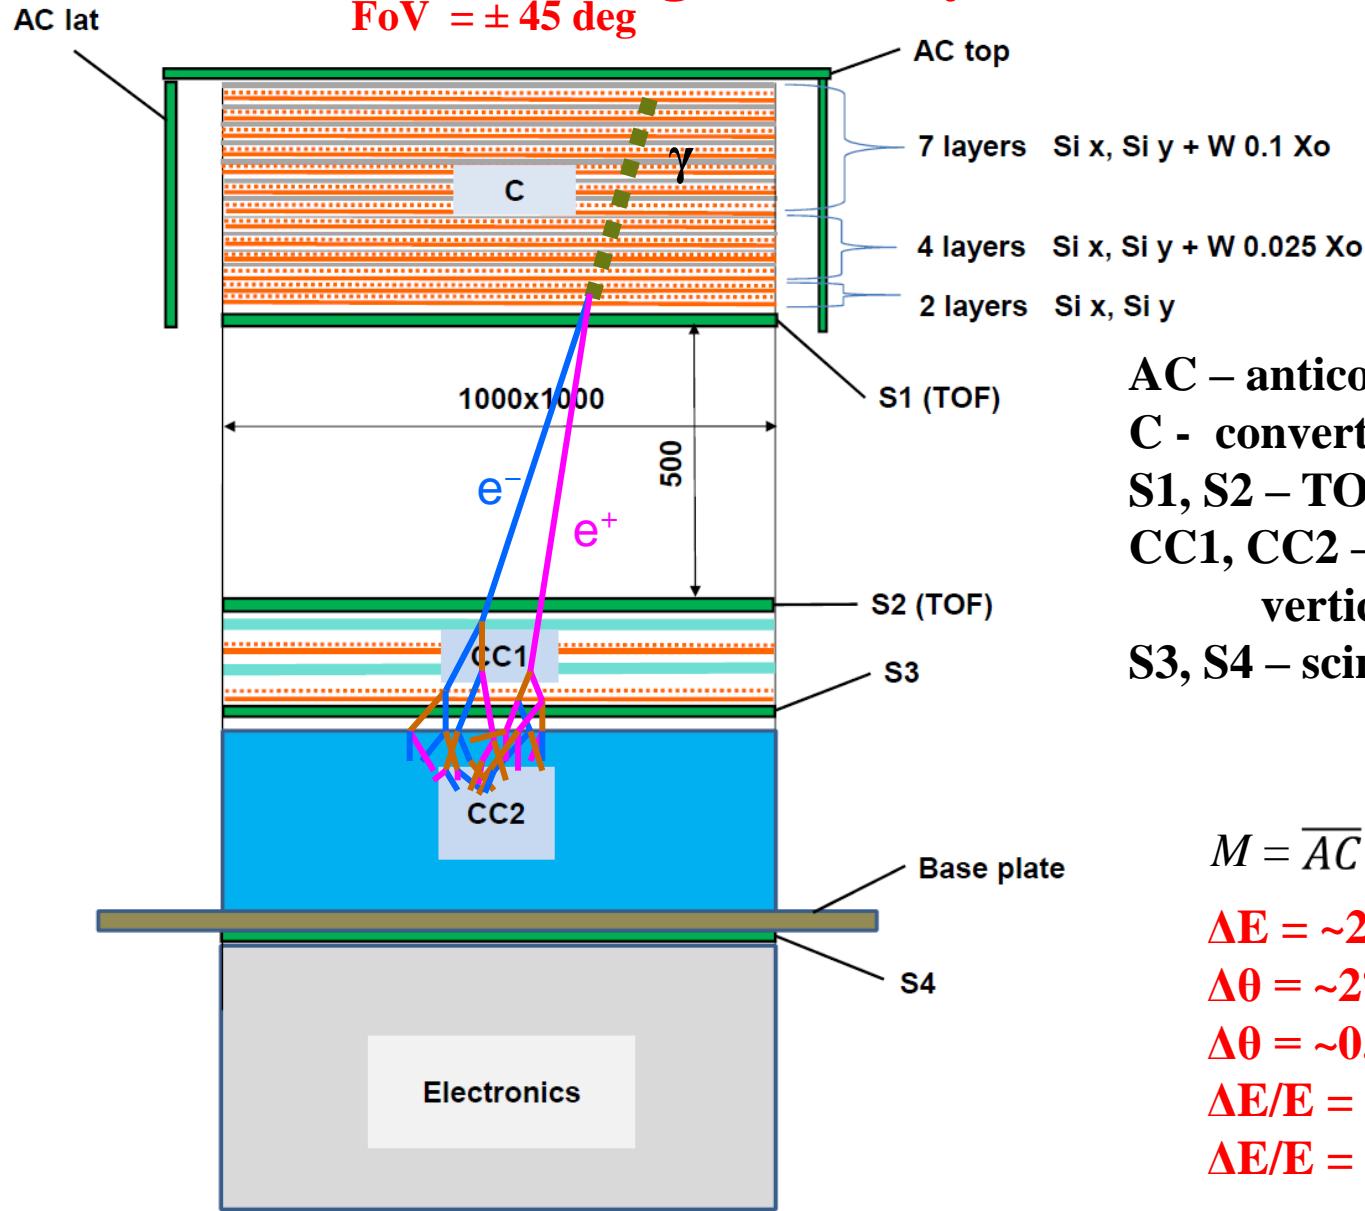

GAMMA-400

MAIN SCIENTIFIC GOALS

The GAMMA-400 main scientific goals are: dark matter searching by means of gamma-ray astronomy; precise and detailed observations of Galactic plane, especially, Galactic Center, Fermi Bubbles, Crab, Vela, Cygnus, Geminga, Sun, and other regions, extended and point gamma-ray sources, diffuse gamma rays with unprecedented angular ($\sim 0.01^\circ$ at $E_\gamma = 100 \text{ GeV}$) and energy resolutions ($\sim 1\%$ at $E_\gamma = 100 \text{ GeV}$), as well as detecting electron + positron fluxes with energies up to 10 TeV.

The GAMMA-400 physical scheme (gamma-ray detection)

AC – anticoincidence system

C - converter-tracker $\sim 1 X_0$

S1, S2 – TOF detectors

CC1, CC2 – calorimeter

vertical thickness $\sim 22 X_0$

S3, S4 – scintillator detectors

$$M = \overline{AC} \times S1 \times S2$$

$$\Delta E = \sim 20 \text{ MeV} - \sim 10 \text{ TeV}$$

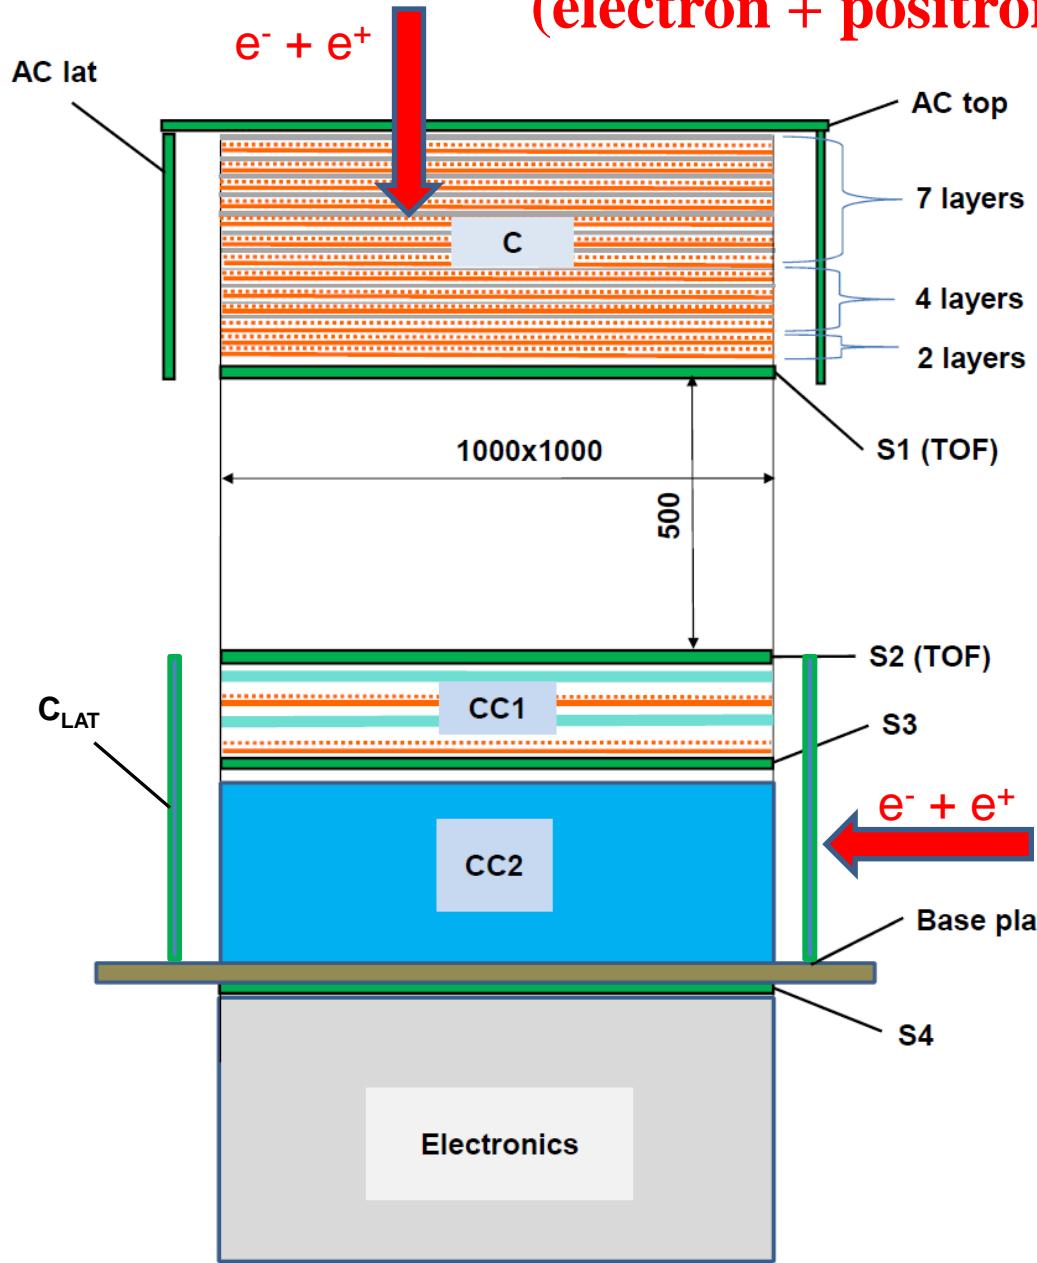

$$\Delta\theta = \sim 2^\circ (E_\gamma = 100 \text{ MeV})$$

$$\Delta\theta = \sim 0.01^\circ (E_\gamma = 100 \text{ GeV})$$

$$\Delta E/E = \sim 10\% (E_\gamma = 100 \text{ MeV})$$

$$\Delta E/E = \sim 1\% (E_\gamma = 100 \text{ GeV})$$

The GAMMA-400 physical scheme (electron + positron detection)

AC – anticoincidence system

C - converter-tracker $\sim 1 X_0$

S1, S2 – TOF detectors

CC1, CC2 – calorimeter

vertical thickness $\sim 22 X_0$

lateral thickness $\sim 54 X_0$

S3, S4 – scintillator detectors

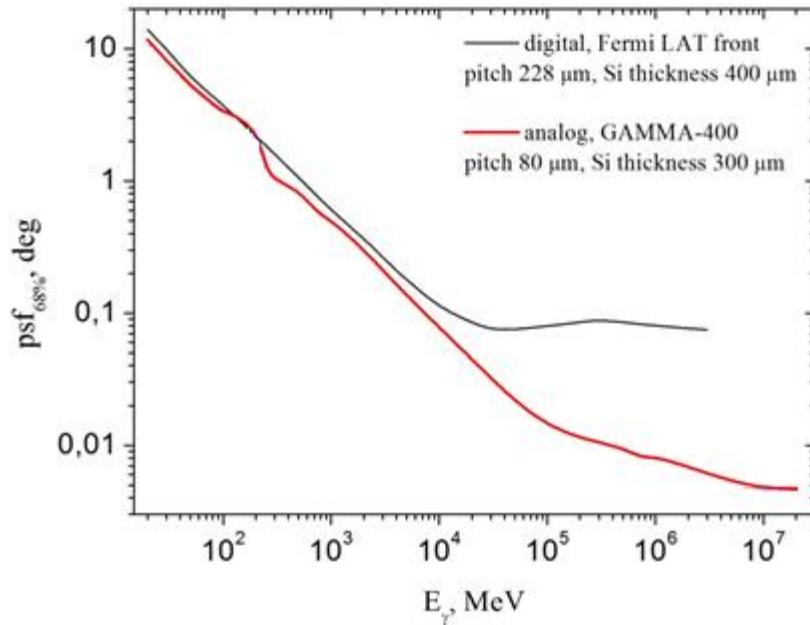

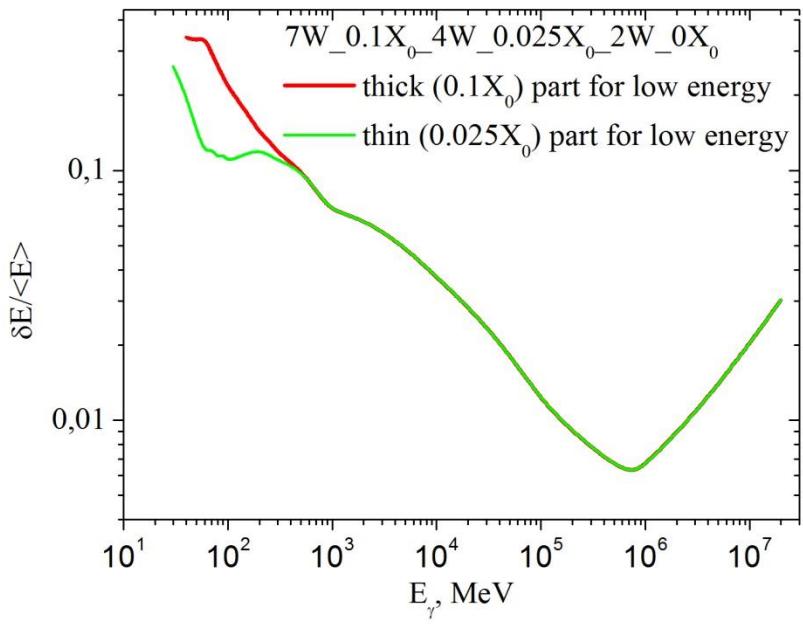

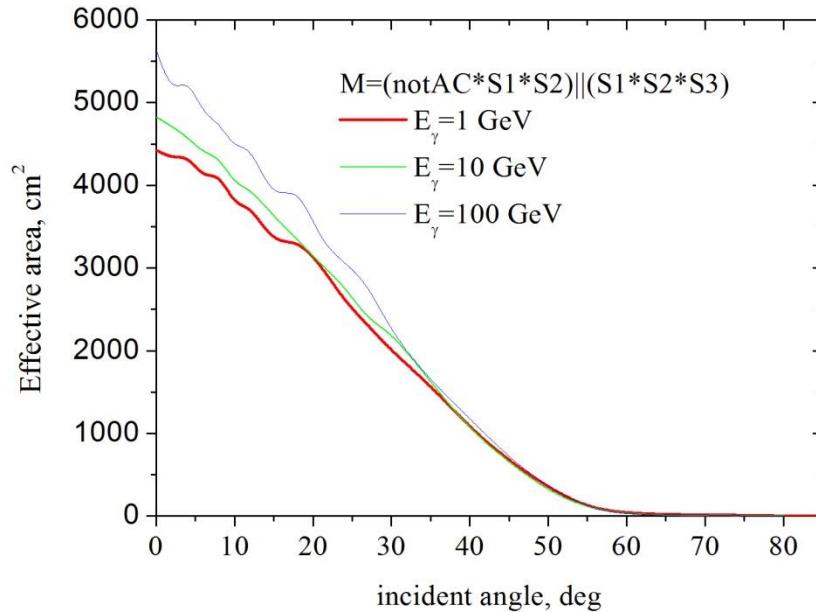

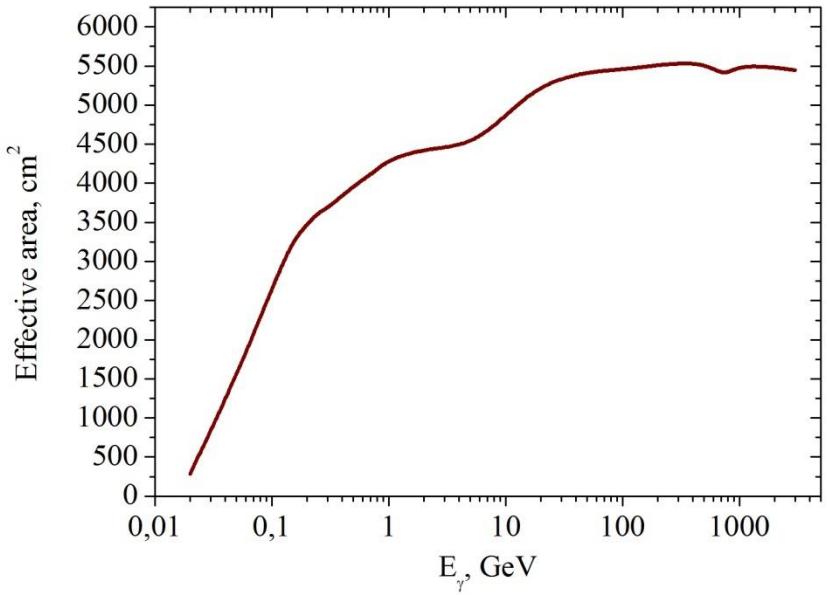

C_{LAT} – lateral calorimeter detectors

$GF_{CR} > 3 \text{ m}^2\text{sr}$ (all sides)

$\Delta E = \sim 1 \text{ GeV} - \sim 10 \text{ TeV}$

$\Delta\theta = \sim 0.01^\circ$ ($E = 100 \text{ GeV}$)

$\Delta E/E = \sim 1\%$ ($E = 100 \text{ GeV}$)

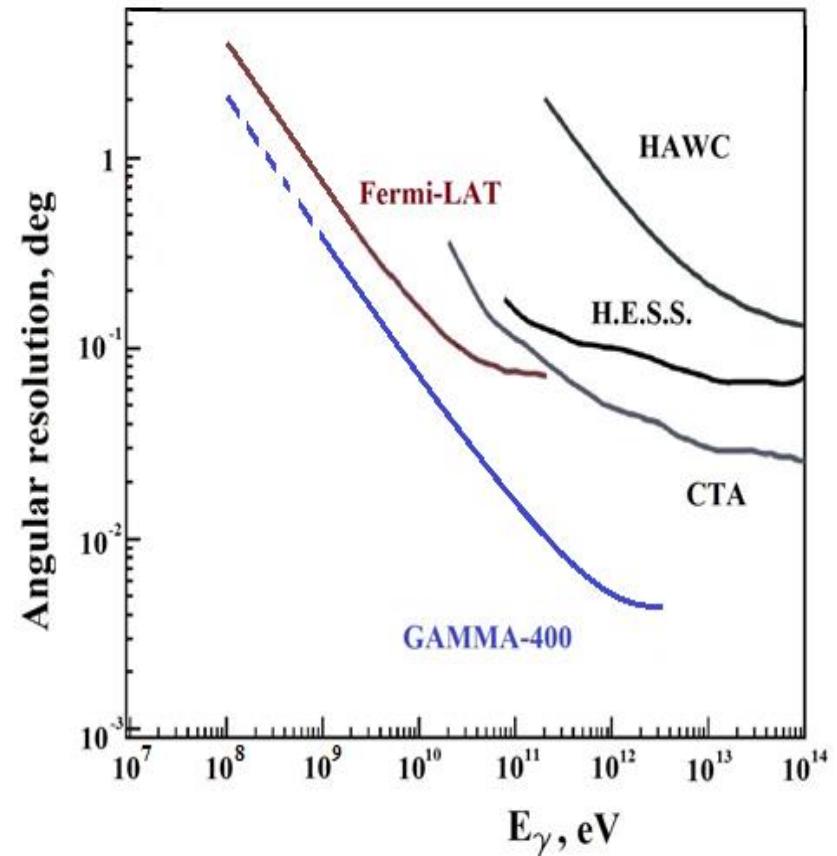

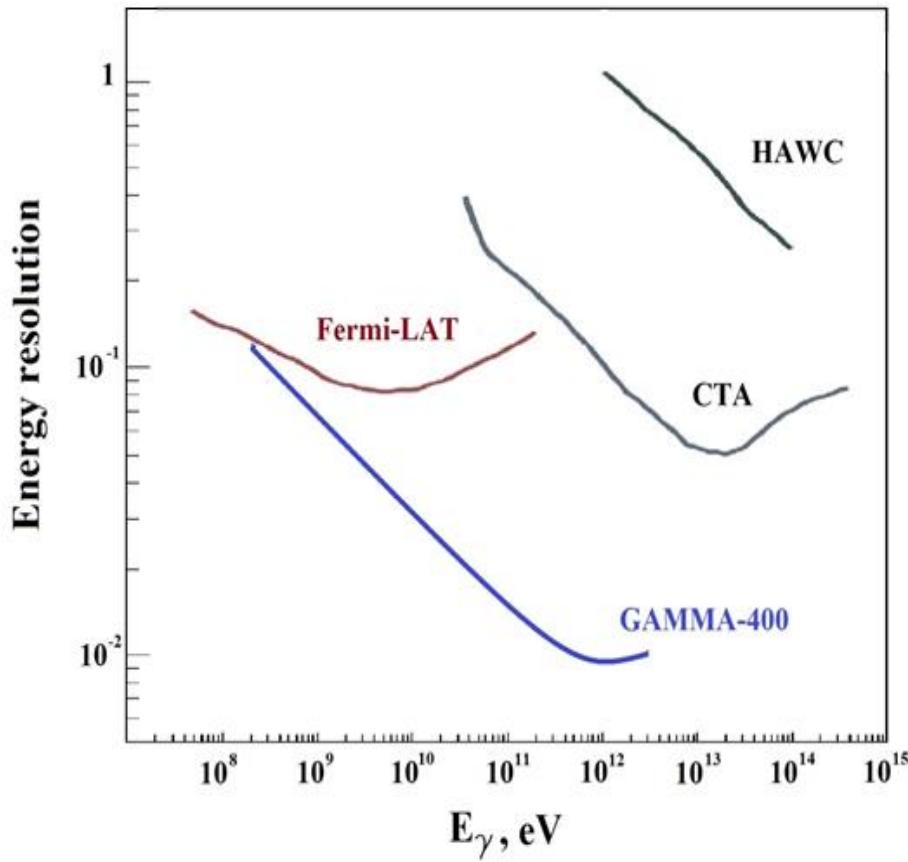

Comparison of the main parameters for GAMMA-400 and Fermi-LAT

	Fermi-LAT	GAMMA-400
Orbit	Circular, 565 km	Highly elliptical, 500-300000 km (without the Earth's occultation)
Operation mode	Sky-survey (3 hours)	Point observation (up to 100 days)
Source exposition	1/8	1
Energy range	~100 MeV - ~300 GeV	~20 MeV – ~10 TeV
Effective area ($E_\gamma > 1$ GeV)	~5000 cm ² (front)	~4000 cm ²
Coordinate detectors - readout	Si strips (pitch 0.23 mm) digital	Si strips (pitch 0.08 mm) analog

Comparison of the energy and angular resolutions for GAMMA-400, Fermi-LAT, HAWC, and CTA

Comparison of the capabilities to study Galactic Center by Fermi-LAT with the angular resolution of $\sim 0.1^\circ$ for $E_\gamma = 100 \text{ GeV}$ (yellow circle) and GAMMA-400 with the angular resolution of $\sim 0.01^\circ$ for $E_\gamma = 100 \text{ GeV}$ (red circle), using Chandra X-ray observation. The Sgr A* position is marked by cross.

Comparison of the Fermi-LAT and GAMMA-400 capabilities to resolve gamma-ray lines from dark matter particles

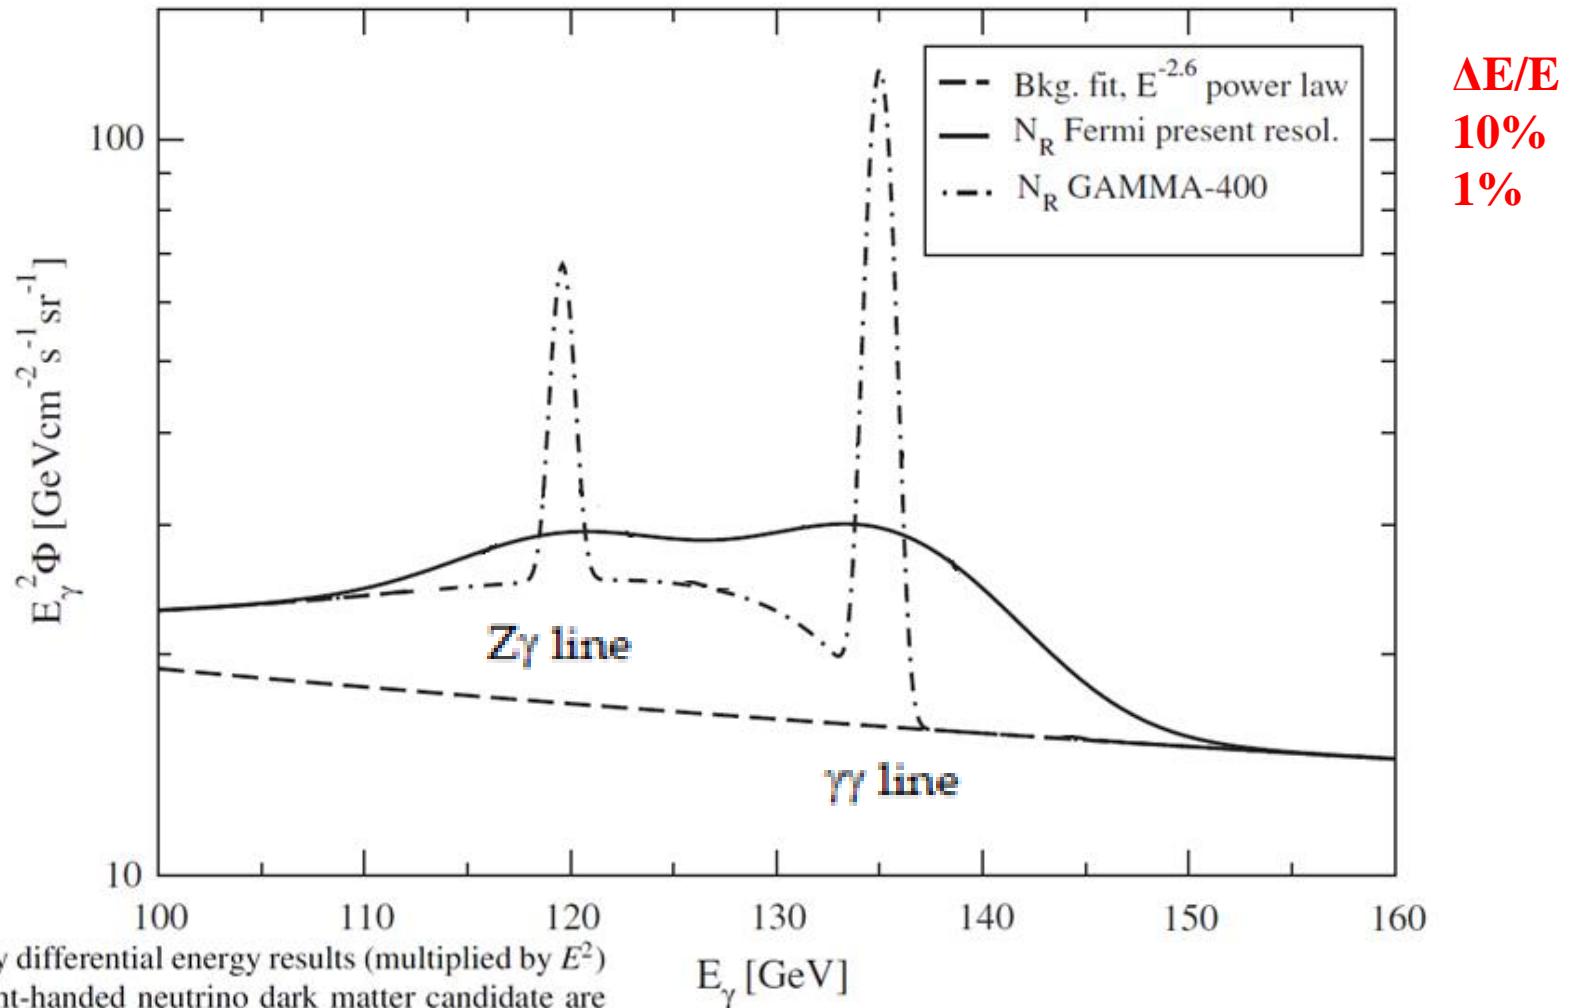

FIG. 3. The γ -ray differential energy results (multiplied by E^2) for a 135 GeV right-handed neutrino dark matter candidate are shown, with the present Fermi-LAT energy resolution $\Delta E/E = 10\%$ FWHM (solid line)

and with a future γ -ray instrument, such as GAMMA-400 [38] (dash-dotted line) with resolution at the one percent level. The extrapolated power-law $\sim E^{-2.6}$ of the presently measured continuous γ -ray background is also shown.

PHYSICAL REVIEW D 86, 103514 (2012)

130 GeV fingerprint of right-handed neutrino dark matter

The GAMMA-400 orbit evolution and observation modes

The orbit of the GAMMA-400 space observatory will have the following initial parameters:

- an apogee of 300 000 km;
- a perigee of 500 km;
- an inclination of 51.4°

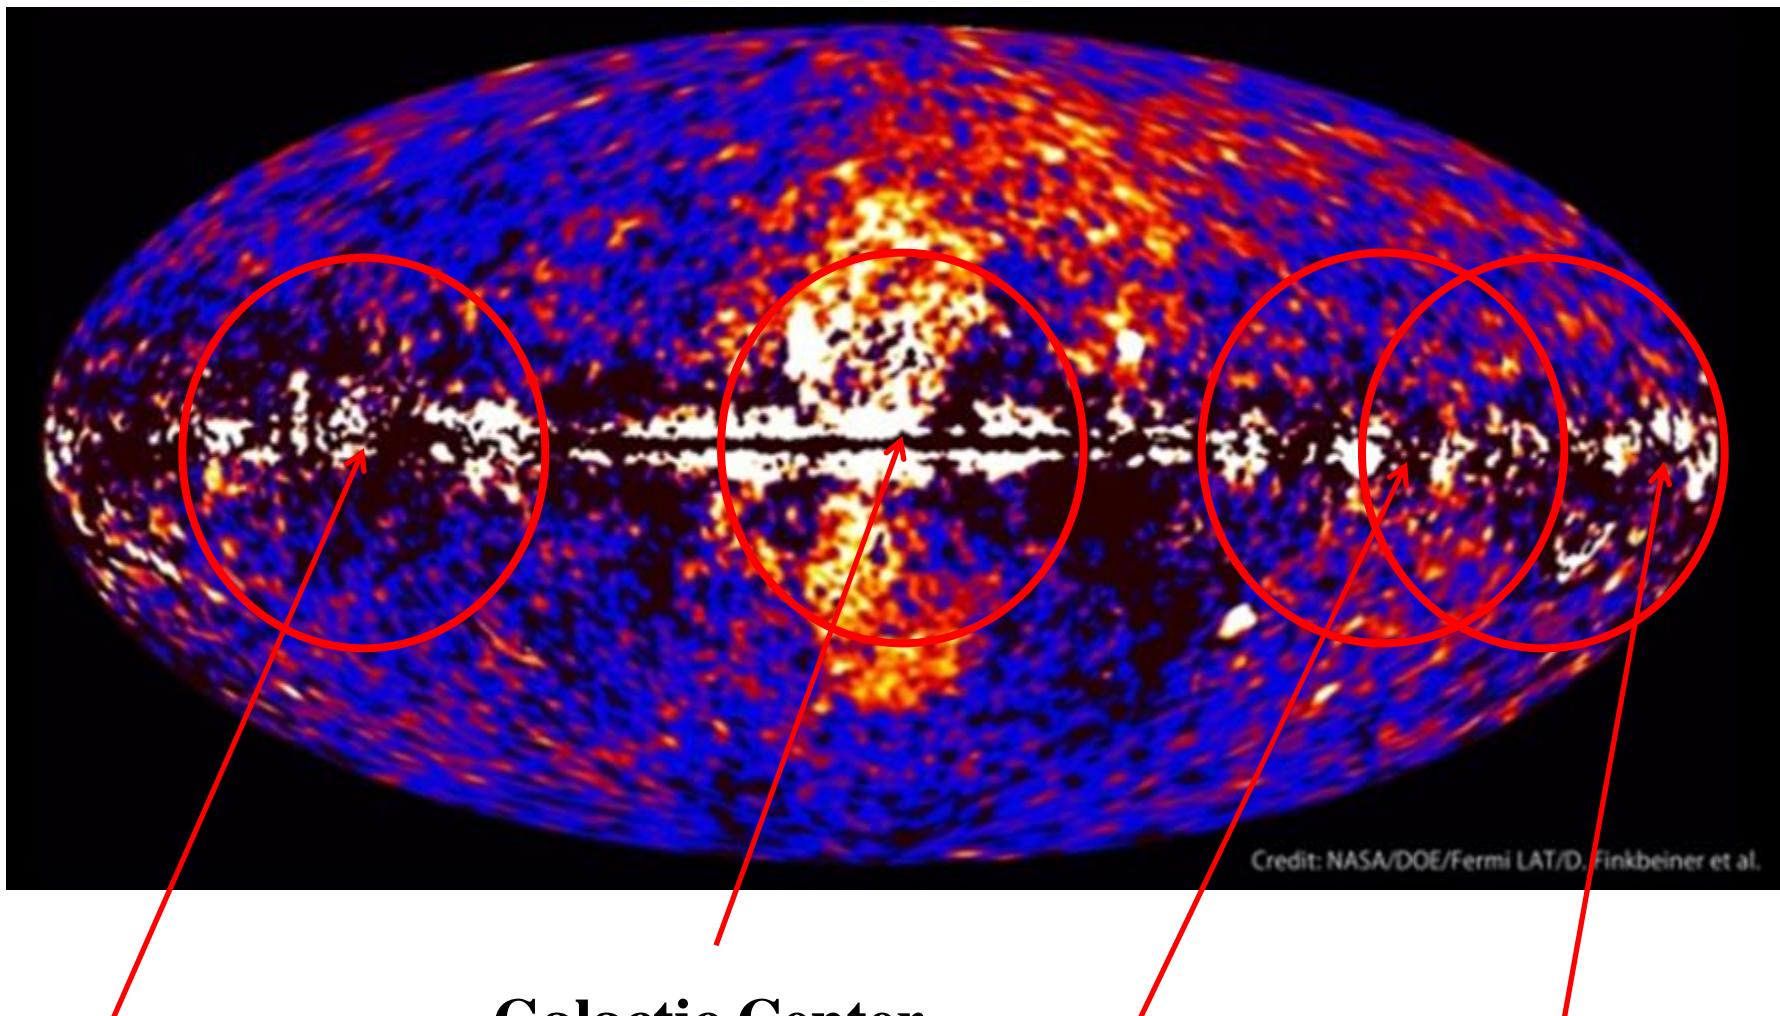

Time of operation will be 7-10 years

The main observation mode will be continuous long-duration (~100 days) observations of the Galactic Center, extended gamma-ray sources, etc.

Under the action of gravitational disturbances of the Sun, Moon, and the Earth after ~6 months the orbit will transform to about circular with a radius of ~200 000 km and will be without the Earth's occultation and out of radiation belts.

Galactic Center, Fermi Bubbles, Crab, Cygnus, Vela, Geminga, and other regions will be observed with the GAMMA-400 aperture of $\pm 45^\circ$

Cygnus

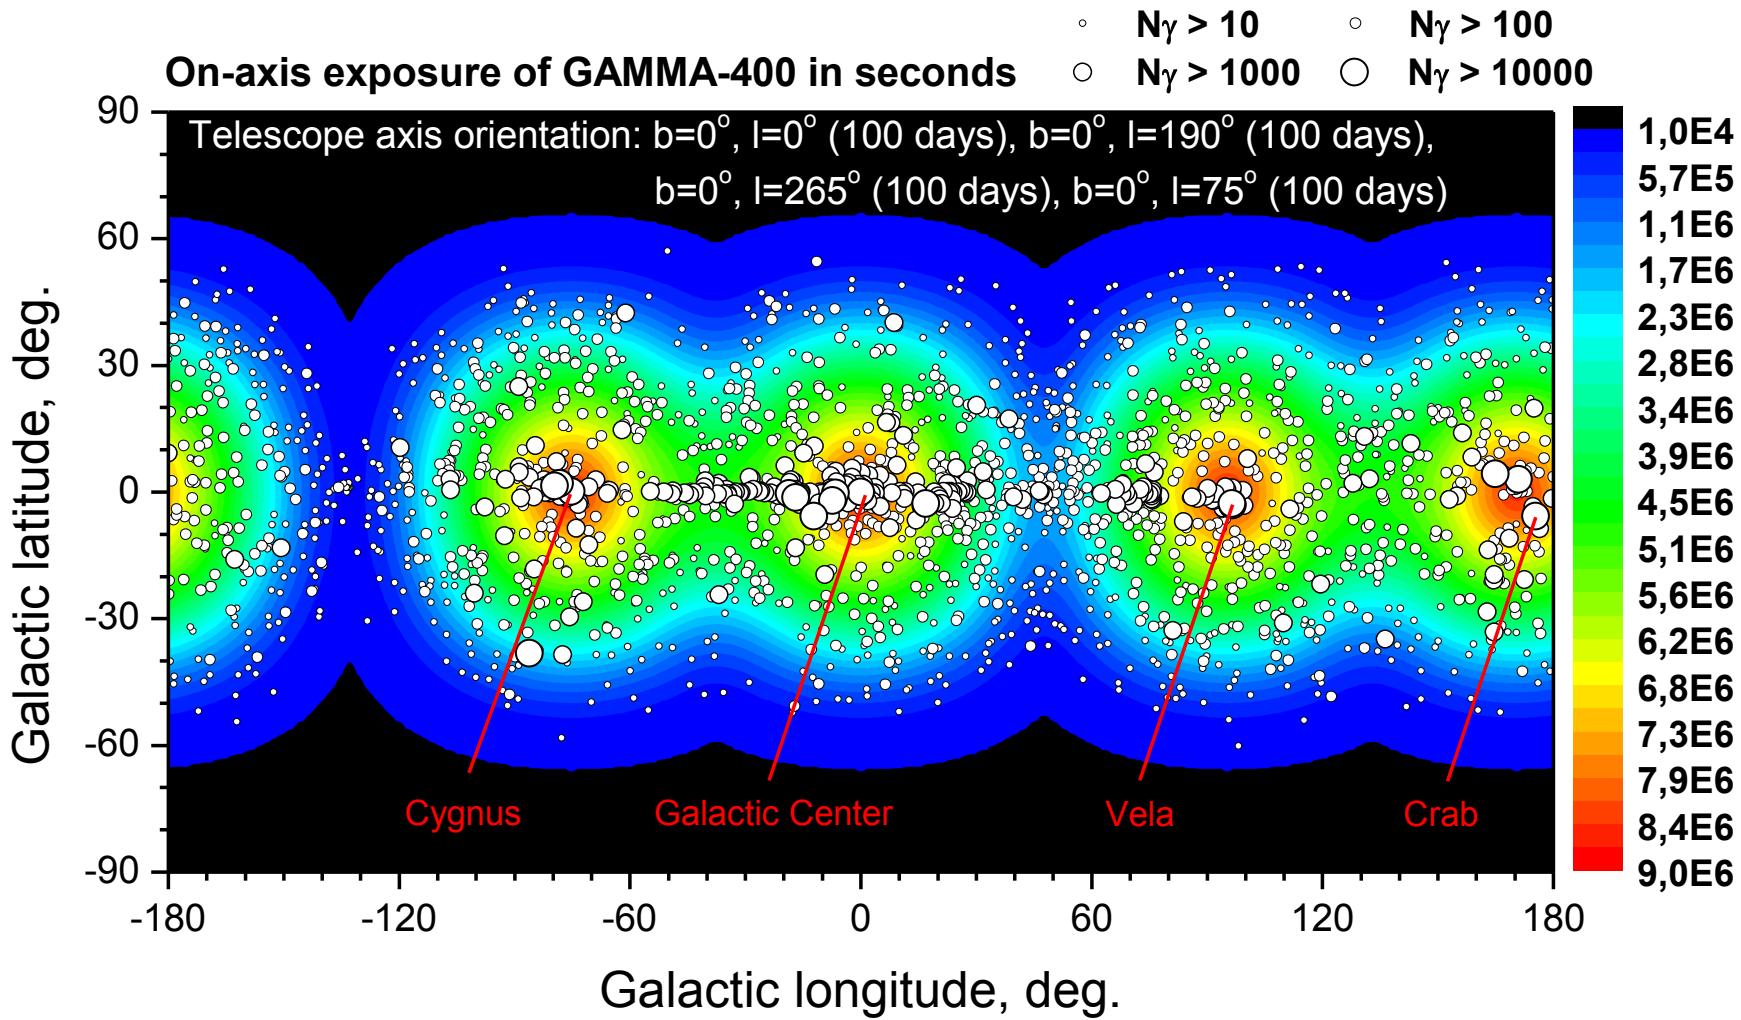

**Galactic Center,
Fermi Bubbles**

Vela

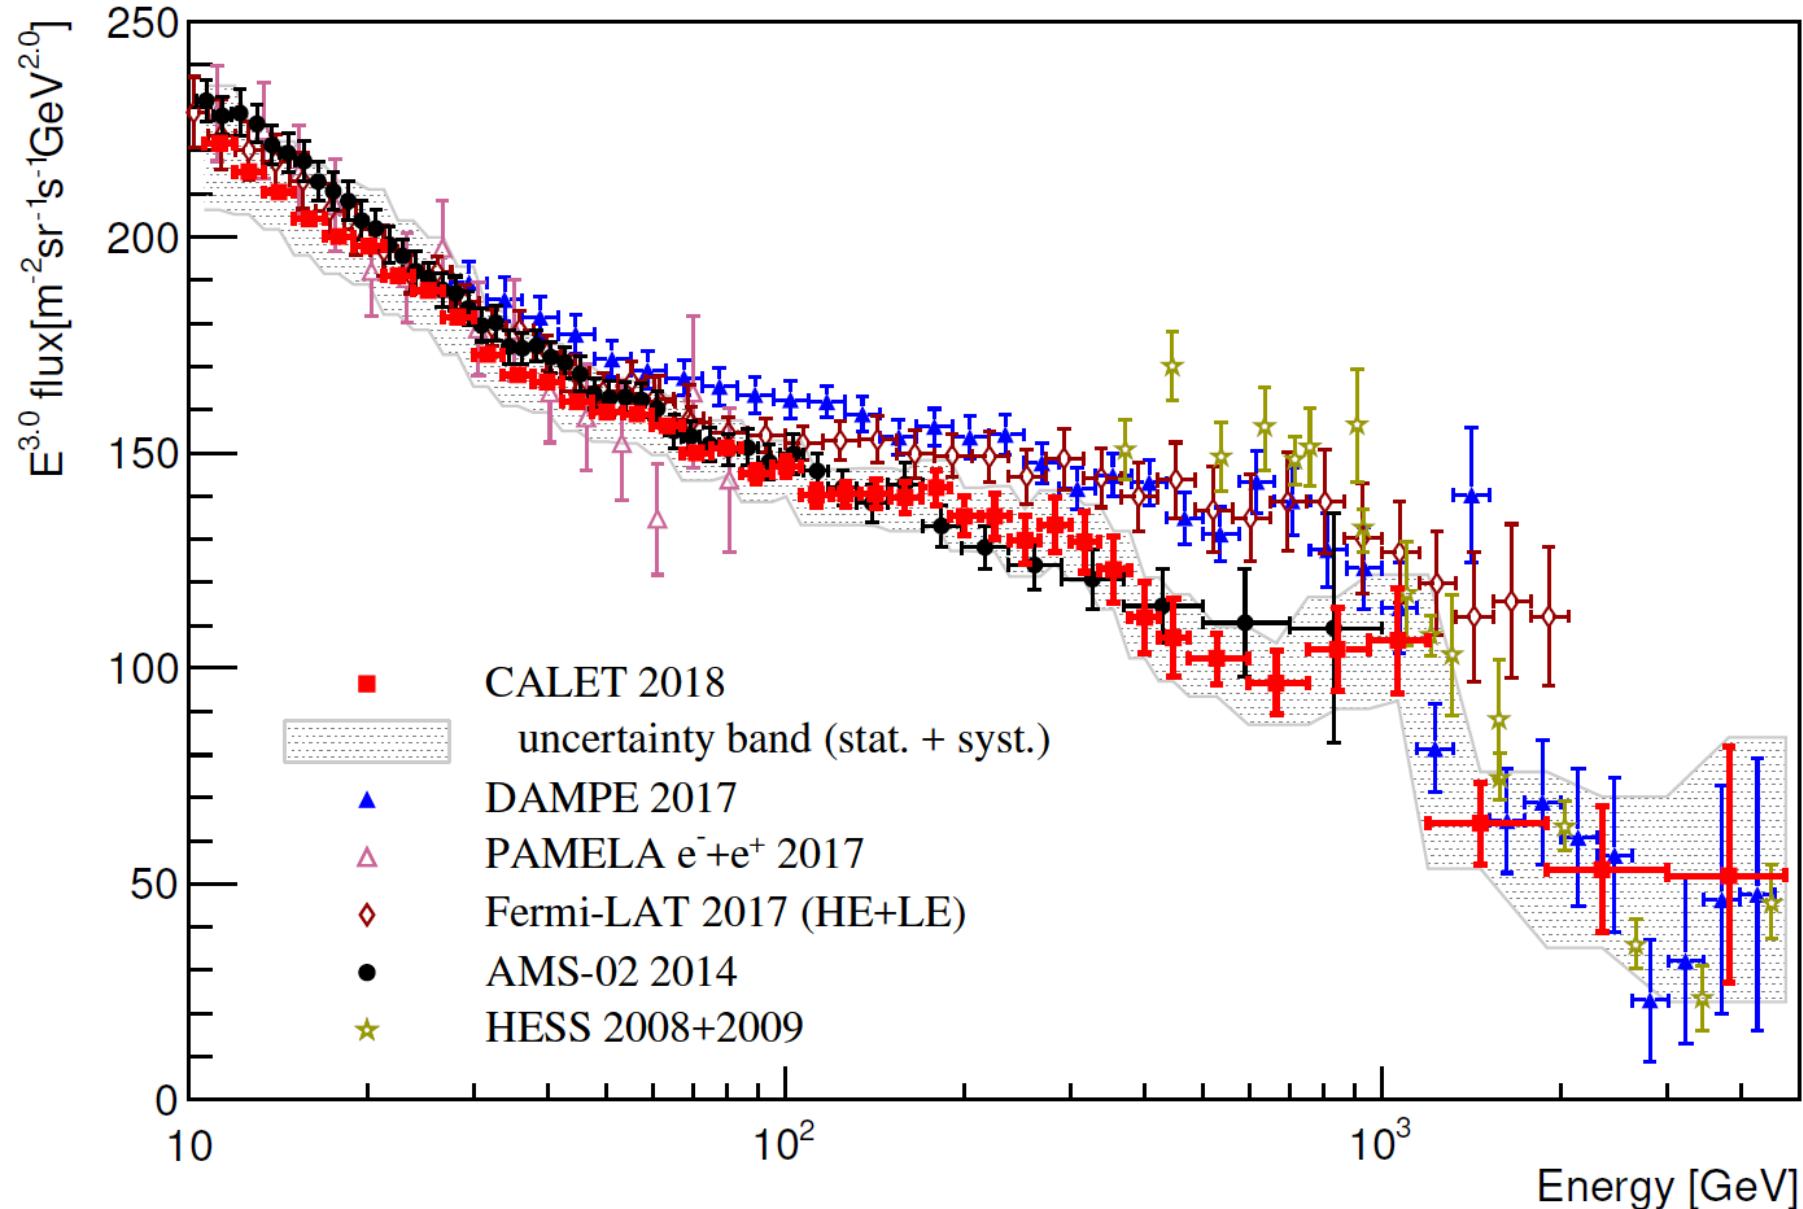

Crab, Geminga

**Number of simultaneously and uninterruptedly observed sources
(at $N_\gamma > 10$ for each source) and number of gammas, when observing
Galactic center, Crab + Geminga, Vela, and Cygnus regions
by GAMMA-400 (effective area = 4000 cm², T_{obs} = 100 days, aperture ±45°),
using the data from 3FGL for different energy ranges**

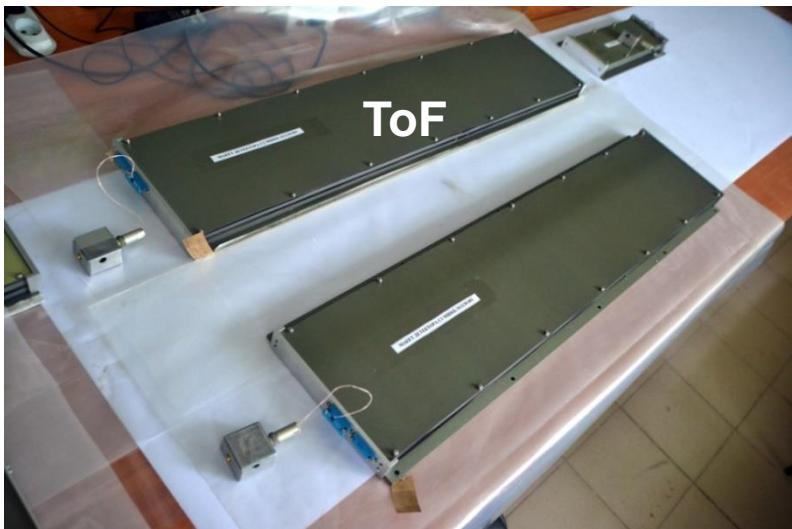

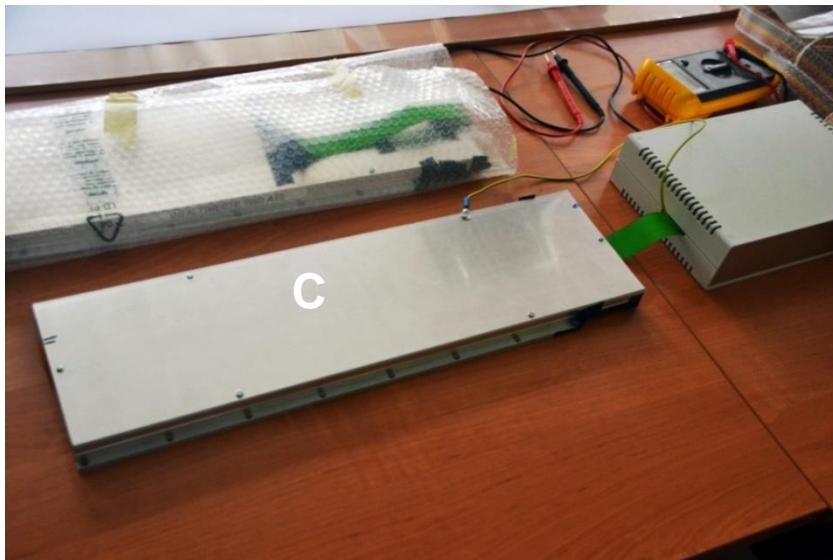

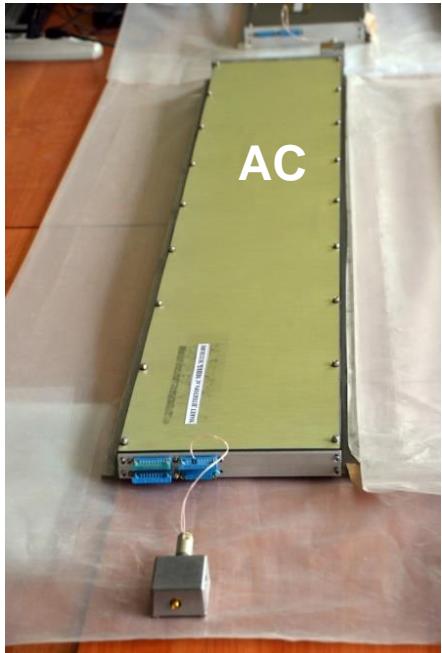

Energy range	100 MeV-100 GeV		1 GeV-100 GeV		10 GeV-100 GeV	
Direction	N _{sources}	N _{γ}	N _{sources}	N _{γ}	N _{sources}	N _{γ}
Galactic center $b=0^\circ, l=0^\circ$	723	523146	422	47505	21	1364
Crab + Geminga $b=0^\circ, l=190^\circ$	495	310384	175	39163	11	1020
Vela $b=0^\circ, l=265^\circ$	649	523077	280	63253	9	1163
Cygnus $b=0^\circ, l=75^\circ$	604	318788	269	30941	12	1007

Conclusions

- After Fermi-LAT the GAMMA-400 mission represents a unique opportunity to significantly improve the direct data of LE+HE gamma rays and electron + positron fluxes due to unprecedented angular and energy resolutions, large area, and continuous long-term observations.
- GAMMA-400 is funded by the Russian Space Agency and according to the Russian Federal Space Program 2016-2025 the GAMMA-400 space observatory is scheduled to launch in ~2025.
- We are open to the participation of foreign scientists in the manufacture of some detector systems.
